

# TRUE METAL

A new range of metallic paints created from a wax base. Made from high quality pigments, achieving extremely realistic effects. The basic product can be used in all branches of scale modelling, and it can be applied by brush, with the fingertip, or with a cotton swab. Once dried, it can be polished to achieve a metallic finish.

1

It is better to prime first so that the product sticks best to the surface.

2

Start to spread it over the desired area, in this case we are using the fingertip but you can use a cotton swab or a napkin.

3

Result with the product applied.

4

Start polishing with a cloth.

5

The more you polish the shinier it becomes, it always depends on the desired effects.

6

We have polished thoroughly to get a high metallic gloss.

7

If you find some places without enough wax place it and start over the polishing process.

8

Torpedo ready for the next phase.

9

We start masking to use another kind of metal for the tip.

10

Apply it carefully to avoid irregularities.

11

The mask applied.

12

Repeat the same process with another metallic wax in this case we have used copper.

13

Spread properly the product over the desired area.

14

Depending on the result to achieve, we polish in some way or another, less polishing would mean an older metal while polishing a lot means newer metal.

The torpedo finished, with some acrylic weathering applied.

Weathering detail.

In this case we are using a Tiger wheel at 1/4 scale.

Start to spread the Gun Metal color over the wheel.

Wheel with the wax completely spread.

Start polishing as much as we want, as always depending on the result to achieve.

Final result.

Yet another example over a propeller.

In this case we have used the Brass color.

Polish it as usual.

This part is a periscope from Bronco Type XXIII scale model.

Polish as usual.

And see the amazing result.
